PicoLisp Wiki Markup Syntax

The Wiki Markup has a very simple syntax. It always starts with a single character (that specifies the type of markup) followed by an opening brace, and extends till the matching closing brace.

Currently, the following markup types are supported:

```
3{Heading}                  Heading (level 3)
                            Levels 1 .. 6 are allowed

&{3}                        Insert 3 line breaks
&{-3}                       Insert 3 line breaks, clear float style

/{italic}                   Italic font
!{bold}                     Bold font
_{underline}                Underlined font

*{                          Unordered list
   -{List item 1}              List items
   -{List item 2}
}

+{                          Ordered list
   -{List item 1}              List items
   -{List item 2}
}

<{content}                  Left-floating content (e.g. image, video)
@{content}                  Non-floating content (e.g. image, video)
>{content}                  Right-floating content (e.g. image, video)

={Doc Page}                 Internal link to the document "Doc"
                               The optional label text is "Page"

^{http://ext.org Text}      External link to "http://ext.org"
                               The optional label text is "Text"

:{formatted}                Pre-formatted text

\{                          Escaped brace

#{comment}                  Comment
```

Quickstart PicoLisp Wiki

How to contribute to the PicoLisp Wiki? First, you need an account. Click on the *Log in* link, then press the *Create account* button on the next page and fill out the form.

Once you are logged in with you new account, go to the wiki section where you want to add something, e.g. the *Articles & Essays* page. Click on the *edit* link on top of the page.

Add a new internal link to the page that points to your (still non-existing) new article:

```
={myarticle This is a short description of my article}
```

Add a *Summary* for your change, have a look at the *Preview*, and when the new link looks fine, save the page.

Refresh the edited page and click on the new link. You will be offered to create the new (but still non-existing) page the link points to, i.e. you will be offered a form for your new page *myarticle*.

Write your article inside the form, using the syntax described above, don't forget to add a little *Summary* message like "Added my first article", have a look at the *Preview* again, and then save it.

Now your new article should exist in the wiki, and it should be accessible from the *Articles & Essays* page.
